
Analisi di $W(v)$ — Bound Teorici vs Dati Sperimentali
(ia-enron-email-dynamic, 87,273 nodi, $T-\mu=7,900$)
Upper Bound: $\min(T-\mu,\ (\mu+1)|\Lambda(v)|)$
Lower Bound (senza effetti di bordo): $|\Lambda(v)|$
Valori di $|W(v)|$ (senza casi sotto il bound)
Numero finestre rilevanti $|W(v)|$
Cardinalità eventi attivi $|\Lambda(v)|$

Efficacia del Pruning Temporale
(ia-enron-email-dynamic, 87,273 nodi)
Fattore $\frac{T-\mu}{|W(v)|}$ per nodo
Riduzione media: 77.41× (98.2% finestre potate)
Fattore di Guadagno $\frac{T-\mu}{|W(v)|}$
Rango nodi (guadagno decrescente) [scala log]
